Sales reporting and provisional reserve

1. Revenue definition and currency

For this demo, sales revenue means the sum of item quantity multiplied by its historical unit price, minus the line-level discount, for completed orders. Cancelled orders are excluded unless a question explicitly asks about them.

The discount field stores the total discount for a complete order line. It must not be multiplied by quantity again. Revenue is derived from order items, not current product prices.

All sample amounts are integer Iranian rials, with currency code IRR. No implicit conversion to toman is permitted. Dates in the database use the Gregorian calendar in YYYY-MM-DD format.

Revenue does not include shipping, tax or post-sale refunds. The sample database has no costs or refund transactions. Therefore actual net profit and actual refund totals cannot be calculated from this dataset.

Sales reporting and provisional reserve

2. Provisional return reserve

The provisional return reserve rate is 5% of completed-order sales revenue for the selected reporting period. Multiply the period revenue by the rate and divide by 100 to estimate the reserve.

The reserve is a planning estimate, not an observed refund amount, an accounting liability determination or an actual loss. It must be labelled provisional in the answer.

Monthly revenue growth is defined as the current month revenue minus the previous month revenue, divided by the previous month revenue, multiplied by 100. When the previous month revenue is zero, percentage growth is undefined and must not be reported as zero.

For a reserve or growth demonstration, extract the monetary amounts from the database and perform the final arithmetic with the Calculator Tool. Round displayed percentages to 2 decimal places and reserve amounts to whole rials.
